

Course Syllabus: Linear Models - STAT 230

Division	Computer, Electrical and Mathematical Sciences & Engineering
Course Number	STAT 230
Course Title	Linear Models
Academic Semester	Fall
Academic Year	2018/2019
Semester Start Date	08/26/2018
Semester End Date	12/11/2018
Class Schedule (Days & Time)	10:30 AM - 12:00 PM Sun Wed

Instructor(s)

	Course Information
Comprehensive Course Description	Objective: This course is an introduction to the formulation and use of linear models (and generalizations) including parameter estimation and inference for such models in a variety of settings. Emphasis will be split between understanding the theoretical foundations of the models and the ability to apply the models to answer scientific questions. Tentative outline:
	1. Introduction: General context; Linear algebra; Multivariate Gaussian distribution;
	2. Linear Regression Models: Simple/Multiple normal linear regression; Likelihood estimators;
	Geometrical intuition; (Weighted/Generalized) Least squares estimators;
	3. Properties of LSE: Distribution of the LSE; Confidence and prediction intervals; Optimality of LSE;
	Gauss-Markov Theorem;
	4. Diagnostics and Testing: Linearity; Homoskedasticity; Gaussianity; Independence; Coefficient of
	determination R2; Residuals; Outliers; Leverage points; Hypothesis tests;
	5. ANOVA: One-way analysis of variance; Orthogonality; F-tests;
	6. Model Selection: Sequential (forward/backward/stepwise) model selection; Information Criteria
	(AIC/BIC/Cp); Cross-validation;
	7. Multicollinearity: Diagnostics for detection; Ridge regression; LASSO;
	8. Robust Regression: L1 regression; Trimmed least squares; M-estimators;
	9. Non-Linear Regression: Newton-Raphson algorithm; Nonlinear least squares;
	10. Non-Parametric Regression: Kernel smoothing; Splines; Projection-Pursuit regres- sion; Additive
	models; backfitting algorithm.
	11. Generalized Linear Models: Exponential Families; GLMs; Logistic regression.

from Program Guide estimation, interence and the use of such models in a variety of settings, Emphases will be split Detwenn understanding the theoretical formulation of the models and the ability to apply the models to answer scientific questions. Multivariate models; Inference about independence. Goals and Objectives The overall goal of this course is to master the theory of linear models (and their various generalizations covered during the course), their formulation, their estimation and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference, as well as their application to real datasets. In addition, their stimution and inference and the ability of addition and inference and the ability and Statistics. Reference Texts 1. Control of the course), their formulation, their estimation and inference, as well as their application to real datasets. In addition, the students will be able to perform simple data analyses in practice using the statistical software R, and be able to understand and correctly interpret the results and outputs (diagnostics, figures, liables, etc.) from R. All the material covered during the course (lectures and homework) will be mastered by the students. Required Knowledge Advanced and multivariate calculus, Linear algebra, Probability and Statistics.
